Inputs

Needs

- Automatically generated statistics on planned and spent efforts (e.g. of ITEA tables)
- Automatically generated reports on gained SPs (e.g. from closed github issues)

Based on these proposed internal relations

- Nominal $1 \text{ working day} \stackrel{!}{=} 1 \text{ story point (SP)}$
=> 228 SP per year (presumed) *(365 days per year minus weekends, holidays & vacations)*
=> 19 SP / PM
- Optimal Efficiency for Partner is aim: $19 \text{ SP / PM} \stackrel{!}{=} 100 \% \text{ efficient}$

Based on these principles

- SP of feature part should only be assigned to on closing Sprint!
- Sprints last 2 weeks
- SP only to be groomed for one party

Queries:

- Daily: How many story points (SP) are planned for each feature part on
 - WP level?
 - Project level?
- Based on closed issues or subtasks: How many story points (SP) were achieved for each feature part?
- Daily: How many story points (SP) for each Partner
 - are planned ?
 - are achieved?

External Reports

- Reached SP per Partner
- Representing potential capacity for future Sprints

Internal Reports (*non public*)

- Indicating planned and spent effort (ITEA table)
- calculating agile efficiency for each partner
 - a cumulated overall WP efficiency on
 - How many days spent for earning 1 SP
